                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         £
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         continuous peptide-containing targeting vectors for use in clinical positron emission tomography. Radiolabeling thiol-containing peptides with camission tomography. Radiolabeling thiol-containing peptides with calculations of F-18 comprises reacting a peptide comprising a free thiol group with a labeling reagent of formula: 18F-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-(CM2)m-CRIR2-

The characteristics of the chelator, metal chelate complex, therapeutic agent or diagnostic agent can be varied to complex, therapeutic agent or diagnostic agent can be varied to antibodies differing applications without raising new bi-specific antibodies for each new application. The targetable conjugate is selected to elicit sufficient immune responses and also for rapid in vivo clearance when used within the bi-specific antibody targeting method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents an immunogenic peptide for a bi-specific antibody. The invention relates to a method of treating or identifying diseased tissues in a patient comprising administering a bi-specific antibody (or fragment) having at at least 1 arm (A) that specifically binds a targeted tissue and at least 1 arm (B) that specifically binds a targeted conjugate. The methods and bi-specific antibodies and fusion proteins are useful for pre-targeting methods of diagnosis and therapy. It is advantageous to raise bi-specific antibodies against a targetable conjugate that is capable of carrying at least 1 diagnostic or expectable conjugate that is capable of carrying at least 1 diagnostic or expectable conjugate that is capable of carrying at least 1 diagnostic or expectable conjugate that is capable of carrying at least 1 diagnostic or expectable conjugate that is capable of carrying at least 1 diagnostic or expectable conjugate that the capable of carrying at least 1 diagnostic or expectable conjugate that the capable of carrying at least 1 diagnostic or expectable conjugate that the capable of carrying at least 1 diagnostic or expectable confusion and the capable of carrying at least 1 diagnostic or expectable confusion and the capable of carrying at least 1 diagnostic or expectable confusion and the capable of carrying at least 1 diagnostic or expectable confusion and the capable of carrying at least 1 diagnostic or expectable confusion and the capable of carrying at least 1 diagnostic or expectable confusion and the capable of carrying at least 1 diagnostic or expectable confusion and the capable of carrying at least 1 diagnostic or expectable confusion and the capable of carrying at least 1 diagnostic or expectable confusion and the capable of carrying at least 1 diagnostic or expectable confusion and the capable of carrying at least 1 diagnostic or expectable confusion and the capable of carrying at least 1 diagnostic or expectable confusion and the capable of carrying at least 1 diagnostic or expectable 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Bi-specific antibodies that bind specific target tissue and targeted

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents an immunogenic peptide for a bi-specific antibody. The invention relates to a method of treating or identifying diseased tissues in a patient comprising administering a bi-specific antibody (or fragment) having at at least 1 arm (A) that specifically binds a targeted tissue and at least 1 arm (B) that specifically binds a targetable conjugate. The methods and bi-specific antibodies and fusion proteins are useful for pre-targeting methods of diagnosis and therapy. It is advantageous to raise bi-specific antibodies against a targetable complex, therapeutic agent or diagnostic and be varied to accommodate differing applications without raising new bi-specific antibodies for each new application. The taristing new bi-specific antibodies for each new application. The targetable conjugate is selected to elicit sufficient immune responses and also for rapid in vivo clearance when used within the bi-specific antibody targeting method.

This peptide corresponds to amino acid residues 296-302, in the non-conserved region 1, of the outer membrane protein CopB (see AMW4621) of Moraxella catarrhalis strain 035E. Claimed isolated peptides of about 5-60 amino acid residues comprise at least this 7-amino acid peptide sequence and are reactive with monoclonal antibody 10F3. The 7-amino peptide is most preferred for binding to 10F3. It is located C-terminal to the Asn-295 cesidue of CopB that influences the binding kinetics of the epitope. Peptides which contain residues C-terminal to Asn-295 retain reactivity, but this reactivity is less than that obtained in the presence of Asn-295. Claimed peptides (see AAW46274-84) from non-conserved region I can be used in the diagnosis, prophylaxis (as vaccines) and treatment of M. catarrhalis infections.
                                                                                                                                            New isolated Moraxella catarrhalis peptide(s) - which define epitopes of the outer membrane protein used to develop products for the diagnosis, prophylaxis and treatment of infection

It is used in the form of a drug compsn. Residue 4 (Gl\gamma) is modified by calcium and residue 8 (Tr\rho) has an indol gp.

                                                                                                                                                                                            δλ
                                                                                                                                                                                                                                                    ő
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to hybrid polypeptides comprising enhancer peptide sequence linked to core polypeptides. The enhancer polypeptides are derived from various retroviral envelope (9p41) protein sequences, especially from HIV-1, HIV-2 and SIV. The enhancer peptides enhance the pharmacokinetic properties such as increasing the half-life of any core polypeptide that they are linked to. The core polypeptides are any polypeptide that may be introduced into a living system and that can function as a pharmacoligically useful peptide for the treatment or prevention of a disease. The core polypeptides are bloactive peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Retrovirus; hybrid polypeptide; enhancer; gp41; envelope protein; HIV-1; HIV-2; SIV; pharmacokinetic; half-1ife; growth factor; cytokine; viral; anti-fusogenic; differentiation factor; interleukin; interferon; colony stimulating factor; hormone; angiogenic factor.
                                                                                                                                                                                                                                                    Gaps
                                                        non-conserved region 1, of the outer membrane protein CopB (see AAW46271) of Moraxella catarrhalis strain 035E. Claimed isolated peptides of about 5-60 amino acid residues comprise at least this 8-amino acid residues comprise at least monoclonal antibody 10F3. The 8-amino peptide is most preferred for binding to 10F3. It includes the Asn-295 residue of CopB that is required for 10F3 binding. Claimed peptides (see AAW46274-84) from non-conserved region 1 can be used in the diagnosis, prophylaxis (as vaccines) and treatment of M. catarrhalis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A new hybrid polypeptide with enhanced pharmacokinetic properties comprises enhancer sequence -
                                               This peptide corresponds to amino acid residues 295-302, in the

The HR1 and HR2 regions of proteins interact non-covalently with each other and/or with peptides derived from them. This interaction is required for normal infectivity of viruses such as RSV and HIV. The heptad repeat region peptide analogues may be used to inhibit respiratory syncytial virus (RSV) infection in a cell. They may also be used to inhibit HIV infection. The present sequence is a peptide provided in
selected from a growth factor, cytokine, differentiation factor, interleukin, interferon, colony stimulating factor, hormone or angiogenic factor. The peptides of the invention can be used for inhibiting viral infection and can be used in anti-viral and anti-fusogenic treatments. Sequences AAY88651-Y90055 represent core polypeptide fragments that can be used in the invention. Some sequences among those indicated also comprise enhancer fragments at terminal ends and form hybrid polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Heptad repeat region peptide analogs useful for inhibiting virus/cells fusion, useful for treating HIV and Respiratory Syncytial Virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human immunodeficiency virus; HIV; respiratory syncytial virus; RSV; virucide; heptad repeat region; transmembrane protein; gp41; HR1; HR2; infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to isolated analogues of the heptad repeat region peptides pp178 and DP107 correspond to amino acids 638-673 (heptad repeat region HR2) and 558-595 (heptad repeat region HR1) respectively, of HIV-ILAI transmembrane protein gp41. The HR1 and HR2 regions of proteins interact non-covalently with each other and/or with peptides derived from them. This interaction is required for normal infectivity of viruses such as RSV and HIV. The heptad repeat region peptide analogues may be used to inhibit respiratory syncytial virus (RSV) infection in a cell. They may also be used to inhibit HIV infection. The present sequence is a peptide provided in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Heptad repeat region peptide analogs useful for inhibiting virus/cells fluston, useful for treating HIV and Respiratory Syncytial Virus infection -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               e
```

```
The present invention relates to peptides which exhibit anti-retroviral activity. The peptides of the invention (AAU12559-AAU14009) comprise activity. The peptides of the invention (AAU12559-AAU14009) comprise DB178-like and DB107-like peptides. The DB178 peptide corresponds to amino acids 639-673 of the transmembrane protein gp41 from human immunodeficiency virus I (HIV-1) isolate LAI. The DB107 peptide corresponds to amino acids 558-595 of gp41 from HIV-1LAI. The invention of relates to a method of identifying compounds that inhibit the formation of or disrupts a DP107/DP178 complex, both in the presence or absence of a test compound, in a reaction mixture containing DP107 and DP178 peptides. The method is useful for identifying compounds, including small molecule compounds, which may themselves exhibit antilusogenic, antifusogenic, artivital or intracellular modulatory activity. The DP178-like/DP107-like peptides are useful to inhibit human and non-human retroviral, particularly HIV, transmission to uninfected cells. The presents sequence represents one of the DP178-like/DP107-like peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is a core polypeptide which may be linked to
an enhancer peptide to form a novel hybrid polypeptide. The hybrid
con polypeptide exhibits enhanced pharmacokinetic properties relative to
those exhibited by the core polypeptide when introduced into a living
system. It is used to increase the in vitro or ex vivo half-life of
the core polypeptide or the hybrid and core polypeptides can be used for
colled-coil peptide interactions. Other uses include preventing,
colled-coil peptide interactions that involving fusion of
interactions and viral infections that involve cell-cell and/or
infections) and viral infections that involve cell-cell and/or
colled-coil peptides equence increases the human
immunodeficiency virus, respiratory syncytial virus, Epstein Barr
virus, hepatitis B virus, Mason-Pfizer virus and polio virus).

The enhancer peptide sequence increases the half-life and reduces the
clearance rate of therapeutic peptides, which increases their efficacy
and minimises the incidence and severity of adverse side effects.

In addition, this increases the sensitivity of the diagnostic procedure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ó:

Sequence 9, Application US/08232261
Patent No. 5498601
GENERAL INFORMATION:
APPLICANT: Sato, Yoshimi
APPLICANT: Ratada, Jun
TITLE OF INVENTION: Aggregation-Inhibiting Agents, Blood
TITLE OF INVENTION: Coagulation-Inhibiting Agents, Blood
TITLE OF INVENTION: Circulation, Cell Adhesion-Inhibiting Agents, Tumor
TITLE OF INVENTION: Mestastasis-Inhibiting Agents...
NUMBER OF SQUENCES: 14
CORRESPONDENCE ADRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   44.1%; Score 26; DB 5; Length 8; 42.9%; Pred. Trocal receptor beta chain V-D-J region (135-1G) - mouse (fragment)
C; Species: Mus musculus (house mouse)
C; Decies: Mus musculus (house mouse)
C; Decies: Mus musculus (house mouse)
C; Accession: PT0722
B; Feeney, A.J.
C; Accession: PT0722
B; Feeney, A.J.
A; Title: Junctional sequences of fetal T cell receptor beta chains have few N regions.
A; Reference number: PT0509; MUID:91277601
A; Reference number: PT0722
A; Status: translation not shown
A; Molecule type: DNA
A; Residues: 1-7 KFES
A; Experimental source: newborn thymus, strain BALB/C
C; Keywords: T-cell receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                     .;

"Primary structure and biological activity of bradykinin potentiating peptides from Bothrops insularis snake venom.";
-1. Function: THIS PEPTIDE BOTH INHIBITS THE ACTIVITY OF THE ANGIOTENSIN CONVERTING ENTYME AND ENHANCES THE ACTIVITY OF BRADYKININ BY INHIBITING THE KINASES THAT INACTIVATE IT. IT ACTS AS AN INDIRECT HYPOTENSIVE AGENT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                       Peptides 9:429-431(1988).

-!- FUNCTION: THIS PEPTIDE HORMONE INDUCES GALL BLADDER CONTRACTION
AND THE RELEASE OF PANCREATIC ENZYMES IN THE GUT. ITS FUNCTION
IN THE BRAIN IS NOT CLEAR.

-!- SIMILARITY: BELONGS TO THE GASTRIN/CHOLECYSTOKININ FAMILY.
PIR; A430011. A430012.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /SIDSI/gcgdata/hold-geneseq/geneseqp-emb1/AA1980.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     QΥ
                                                                                                                                                                               The invention relates to a method for incorporating 18F radionuclide into peptide-containing targeting vectors for use in clinical positron emission temporaphy. Radiolabeling thiol-containing peptides with canisated alkene in which at least one of the two double bonded a fluorinated alkene in which at least one of the two double bonded a fluorinated alkene in which at least one of the two double bonded a rabon at least one leaving group comprising 1. Br. Cl. azide, tosylate, mesylate, mesylate, nosylate, nosylate, mesylate, mesylate, mesylate, mesylate, riflate. h. m = 0-2; n+m = 0-2; X = 1, Br. Cl. azide, tosylate, mesylate, nosylate, triflate, maleimide of principally substituted by 1-2 alkyl) or 3-sulfomaleimide; Rl. R2 = I, Br. Cl. azide, tosylate, mesylate, nosylate, triflate, maleimide of your carid, tertiary amine, quaternary ammonium, alkyl.

Sr. Cl. azide, tosylate, mesylate, nosylate, triflate, maleimide or quaternary ammonium, alkyl.

Coptionally substituted by CONH2, COOH, OH, sulfonic acid, tertiary amine or quaternary ammonium, coor, coor, on the containing terminate and receptor-targeted peptides for Radiolabeling peptide-containing receptor-targeted peptides for use in routine clinical positron emission tomography. The method is simple and efficient. The method uses the unique property of the free thiol groups which are rapidly alkylated at neutral pH and moderate temperature. Sequences AAY0314-716 represent examples of F-18 labeled peptides used in the method of detecting a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /note= "acetylated; modified with free amino acid group, protected amino acid group, chelating agent or a metal-chelate complex"

conjugate that is capable of carrying at least 1 diagnostic or the cherapeutic agent. The characteristics of the chelator, metal chelate complex, therapeutic agent or diagnostic agent can be varied to accommodate differing applications without raising new bi-specific antibodies for each new application. The targetable conjugate is selected to elicit sufficient immune responses and also for rapid in vivo clearance when used within the bi-specific antibody targeting method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents an immunogenic peptide for a bi-specific antibody. The invention relates to a method of treating or identifying diseased tissues in a patient comprising administering a bi-specific antibody (or fragment) having at at least 1 arm (A) that specifically binds a targetal tissue and at least 1 arm (B) that specifically binds binds a targetale conjugate. The methods and bi-specific antibodies and fusion proteins are useful for pre-targeting methods of diagnosis and tharapy. It is advantageous to raise bi-specific antibodies against a targetable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 18F radionuclide; targeting vector; positron emission tomography; F-18; radiolabeling; thiol; fluorine-18.

into peptide containing targeting vectors for use in clinical positron emission tomography. Radiolabeling thiol-containing peptides with fluorine-18 (F-18) comprises reacting a peptide comprising a free thiol group with a labeling reagent of formula: 18F-(CH2)m-CRRE2-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CH2)m-CRRE3-(CRRE3-(CH2)m-CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CRRE3-(CR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  transfering vectors such as proteins, antibodies, antibody fragments and receptor targeted peptides for use in routine clinical positron emission tomography. The method is simple and efficient. The method uses the unique property of the free thiol groups which are rapidly alkylated at neutral pH and moderate temperature. Sequences AAY03714-716 represent examples of F-18 labeled peptides used in the method of detecting a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method for incorporating 18F radionuclide

into peptide containing targeting vectors for use in clinical positron emission tomography. Radiolabeling thiol-containing peptides with fluorine-18 (F-18) comprises reacting a peptide comprising a free thiol group with a labeling reagent of formula: 18F (CH2)m-CRIR2-(CH2)m-CRIR2 a fluorine-18 (F-18) comprises one of the two double bonded carbon atoms bears at least one leaving group comprising I, Br, Cl, azide, tosylate, nesylate, nesylate, nesylate, mesylate, mesylate, mesylate, mesylate, mesylate, mesylate, mesylate, nosylate, riflate, maleimide (optionally substituted by 1-2 alkyl) or 3-sulfomaleimide; R1, R2 = I, Br, Cl, azide, tosylate, mesylate, triflate, H, COMH2, COMH, COMH, sulfonic acid, tertiary amine, quaternary ammonium, alkyl (optionally substituted by COMH2, COOH, OH, sulfonic acid, tertiary amine or quaternary ammonium, alkyl The method is used for Radiolabeling peptide-containing peptide-containing peptide-containing targeting carbon acid, tertiary amine or quaternary ammonium, cook, CONR2 or COR; and R = 1-6C alkyl or targeting carbon acid, tertiary amine or quaternary ammonium, alkyl and carbon acid, tertiary amine or quaternary ammonium, cook, CONR2 or COR; and R = 1-6C alkyl or targeting carbon acid, tertiary amine acid, tertiary amine carbon acid, acid,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               targeting vectors such as proteins, antibodies, antibody fragments and receptor- targeted peptides for use in routine clinical positron emission tomography. The method is simple and efficient. The method uses the unique property of the free thiol groups which are rapidly alkylated at neutral pH and moderate temperature. Sequences AAY03114-716 represent examples of F-18 labeled peptides used in the method of detecting a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method for incorporating 18F radionuclide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to the use of certain heptapeptide somatostatin derivatives and/or phenylhydrazone derivatives for the preparation of medicaments possessing neurogenic and/or non neurogenic antiinflammatory and/or analgesic effects. The derivatives are used for treating pain and for treating neurogenic inflammation in the pathomechanism of rhinitis, bronchitis, bronchial asthma, arthritis, allergic conjunctivitis, urticaria, colitis and psoriasis. The present sequence is a preferred example of a heptapeptide somatostatin derivative for use in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Helyes Z, Erchegyi J, Horvath A;

The derivatives are used for treating pain and for treating neurogenic inflammation in the pathomechanism of rhinitis, bronchitis, bronchial asthma, arthritis, allergic conjunctivitis, urticaria, colitis and psoriasis. The present sequence is a preferred example of a heptapeptide somatostatin derivative for use in the invention.
                                                        Somatostatin derivative VZ-1038 for antiinflammatory or analgesic use.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Horvath A;

                                                                                                                                                                                                                                                                10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Key
                                                                                                                                                                                                                                                                                           AAB59641
                                                                                                                                                                      g
                                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 conjugate that is capable of carrying at least 1 diagnostic or therapeutic agent. The characteristics of the chelator, metal characteristics of the chelator, metal complex, therapeutic agent or diagnostic agent can be varied to accommodate differing applications without raising new bi specific antibodies for each new application. The targetable conjugate is selected to elicit sufficient immune responses and also for rapid in vivo clearance when used within the bi-specific antibody targeting method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents an immunogenic peptide for a bi-specific antibody. The invention relates to a method of treating or identifying diseased tissues in a patient comprising administering a bi-specific antibody (or fragment) having at at least 1 arm (A) that specifically binds a targeted tissue and at least 1 arm (B) that specifically binds a targeted tissue and at least 1 arm (B) that specifically binds a targeted tissue are transfer and instance brispecific antibodies and fusion proteins are useful for pre-targeting methods of diagnosis and therapy. It is advantageous to raise bi-specific antibodies against a targetable
                                                                                                                                                                                                                                                                                                                                                                                                                                         Immunogenic peptide; bi-specific antibody; diagnosis; immune response; diseased tissue identification; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Bi-specific antibodies that bind specific target tissue and targeted
                                                                                                                                                                                                                                                                                                                                                                                  Immunogenic peptide for bi-specific antibody recognition.

while still bonded to the solid phase. The products of the invention have cytostatic activity and are tyrosine kinase inhibitors. (I) inhibits and the tyrosine kinase activity of various human stomach cancer cell lines and thus inhibits cellular proliferation. The heptapeptide (I) described in the invention is a somatostatin analog which shows strong antitumor eativity in vitro and in vivo. The SP synthesis method gives (I) is more which the cyclization is carried out after cleaving the peptide from the which the cyclization is carried out after cleaving the peptide from the sin. The solution method is also a simple synthesis of (I) in high yield; typically the tert-buty1-protected precursor can be oxidized in a yield of 70-80%. Ax51896-x51900 repersent peptides used in the synthesis of biostatin T7232 described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             tumour; cancer; neoplasm; malignancy; psoriasis; regulation of; release of; growth hormone; insulin; glucagon; prolactin; inhibit exopeptidase; inhibit tumour growth; tumour transformation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   G, Csuka O, Horvath A, Horvath J, Idei

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Somatostatin agonists include the somatostatin analogs shown in AARS6777 848 and AAR6074 83. These peptides are used in the invention to inhibit the accelerated growth of tumours. The growth is induced surgically and the tumour is of epithelial origin, eg. lung or colon tumours or partic. prostate or breast tumours, or melanoma. The peptides are known inhibitors of cancer cell growth and are partic. applied to the site of trauma, topically or subcutaneously.
                                                                                                                                                               Gaps
          and selective pharmacological action than somatostatin. It has a structure inhibiting the activity of exopeptidases. It can be used in medicaments to inhibit tumour growth or the activity of tyrosine kinase enzymes involved in tumour transformation. It is also useful
                                                    for regulating the release of growth hormone, insulin, glucagon and prolactin. It may also be used to inhibit pathological processes such as psoriasis, elicited by the pathological proliferation of
                                                                                                                                                                                                                                                                                                                            Somatostatin analog 41 - acts as agonist to inhibit tumour growth.
This peptide is a somatostatin analogue showing more advantageous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Inhibiting accelerating tumour growth after trauma, esp surgery by treatment with somatostatin or its agonists, esp applied to the site of trauma

This peptide is a somatostatin analogue which has activity in inhibiting the release of growth hormone. It can be used for the treatment of diseases characterised by an imbalance of growth hormone. In particular, it can be used for the treatment of endocrine tumours and acromegaly. The peptide can also be used as a diagnostic agent for tumours. It is particularly active compared with known somatostatin analogues (eg. Antarelix or Lanreotide) or somatostatin.

The method is for the inhibition of fibrosis by the administration of somatostatin or particularly its agonists. The method is specifically used against fibrosis in the kidney, lung, liver or skin (particularly where caused by chemotherapy but also the result of glomerulonephritis, diabetes, cirrhosis, allograft rejection or infection with human immune deficiency virus), also in the central nervous system (e.g. intraocular fibrosis) or nose (e.g. masal polyposis). The method can be used therapeutically or prophylactically.
                                                                                                                                                                                                                                                                      Somatostatin; agonist; inhibitor; fibrosis; kidney; lung; liver; skin; chemchkrapy; glomerulonephritis; diabetes; cirrhosis; nasal polyposis; allograft rejection; infection; human immune deficiency virus; therapy; central nervous system; intraocular fibrosis.

/label= Cyclic /note= "The amino terminus and carboxyl terminus are linked by a covalent bond; the amino terminus is substituted with a methyl group."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 7.0 Application US/08286748B

Patent No. 5759542

GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR THE DELIVERY
TITLE OF INVENTION: OF DRUGS BY PLATELETS FOR THE TREATMENT OF
TITLE OF INVENTION: OF DRUGS BY PLATELETS FOR THE TREATMENT OF
TITLE OF INVENTION: OF DRUGS BY PLATELETS FOR THE TREATMENT OF
TITLE OF INVENTION: ARDIOVASCULAR AND OTHER DISEASES
OORRESPONDENCE ADDRESS:
ADDRESSEE: Fish & Richardson
STREET: 225 Franklin Street
CITY: Boston
STATE: Massachusetts
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            COCATION: 1..3
COTHER INFORMATION: /label= Variant residues
COTHER INFORMATION: /note= "The Trp is in the D conformation."

The invention relates to a method for incorporating 18F radionuclide into peptide-containing targeting vectors for use in clinical positron emission tomography. Radiolabeling thiol-containing peptides with comprises reacting a peptide comprising a free thiol group with a labeling reagent of formula: 18F (CH2)m-CR1R2-(CH2)n-X, or a fluorinated alkene in which at least one of the two double bonded arbon bears at least one leaving group comprising 1, Br. Cl. azide, tosylate, mesylate, nesylate, no mean = 0-2; n+m = 0-2; x = 1, Br. Cl. azide, tosylate, mesylate, nosylate, rifilate, M. R2 = 1, Br. Cl. azide, tosylate, mesylate, nosylate, triflate, H. CONH2, COCH, OH, sulfonic acid, tertiary amine, quaternary ammonium, alkyl or phenyl. The method is used for Radiolabeling peptide-containing peptide containing tertiary amine or quaternary ammonium, alkyl or phenyl. The method is used for Radiolabeling peptide-containing receptor-targed peptides for was in routine clinical positron emission tomography. The method is simple and efficient. The method uses the unique property of the free thiol groups which are rapidly alkylated at neutral pH and moderate temperature. Sequences AAV0314-716 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Immunogenic peptide; bi-specific antibody; diagnosis; immune response; diseased tissue identification; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

Immunogenic peptide for bi-specific antibody recognition.

(first entry)

28-APR-2000

```
conjugate that is capable of carrying at least I diagnostic or therapeutic agent. The characteristics of the chelator, metal chelate complex, therapeutic agent or diagnostic agent can be varied to accommodate differing applications without raising new bi-specific antibodies for each new application. The targetable conjugate is selected to elicit sufficient immune responses and also for rapid in vivo clearance when used within the bi-specific antibody targeting method.
                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents an immunogenic peptide for a bi-specific antibody. The invention relates to a method of treating or identifying diseased tissues in a patient comprising administering a bi-specific antibody (or fragment) having at at least 1 arm (A) that specifically binds a targeted tissue and at least 1 arm (B) that specifically binds a targeted tissue and at least 1 arm (B) that specifically binds a targetable conjugate. The methods and bi-specific antibodies and fusion proteins are useful for pre-targeting methods of diagnosis and therapy. It is advantageous to raise bi-specific antibodies against a targetable
                                                                                                                    "D-form residue; modified with free amino acid

```

```
This sequence represents an immunogenic peptide for a bi-specific antibody. The invention relates to a method of treating a bi-specific diseased tissues in a patient comprishing administering a bi-specifically antibody (or fragment) having at at least 1 arm (A) that specifically binds a targeted tissue and at least 1 arm (B) that specifically binds a targetable conjugate. The methods and bi-specific antibodies and fusion proteins are useful for pre-targeting methods of diagnosis and therapy. It is advantageous to raise bi-specific antibodies against a targetable conjugate that is capable of carrying at least 1 diagnostic or therapeutic agent or diagnostic agent can be varied to complex, therapeutic agent or diagnostic agent can be varied to accommodate differing applications without raising new bi-specific antibodies for each new application. The targetable conjugate is selected to elicit sufficient immune responses and also for rapid in vivo clearance when used within the bi-specific antibody targeting method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents a H2 homologue of a prolyl tripoptidase (designated DPP) from Porphyromonas gingivalis. The prolyl tripoptidase has an amidolytic activity, and cleaves a peptide bond in a target polypeptide having at least 4 amino acids. This bond is between a proline and an amino acid attached to the alpha-carboxyl group end of the proline. The polypeptide is useful for identifying inhibitors. These inhibitors are then useful for reducing the growth of bacterium or for protecting an animal from a periodontal disease such as ginglivitis and periodontilis caused by

THE STATE OF THE S

```
The sequences given in AAR34785 and AAR36780 represent proteins which participate in a yeast cell wall beta-glucan assembly pathway.

These proteins represent KREI and KREF respectively, and are essential for normal cell growth. KREI is a Ser/Thr rich protein protein probably probably probably through addition of O-linked mannose healthaly modified, probably through addition of O-linked mannose cesidues. Gene disruption of the KREI locus leads to a 40% reduced cesidues. Gene disruption of the KREI locus leads to a 40% reduced defects in cell wall (1>6) beta-glucan. Mutations at KRE5 also caused defects in cell wall (1>6) beta-glucan production and appears to be defects in cell wall (1>6) beta-glucan production and appears to be objected in which contains the COOH-terminal endoplasmic reticulum (ER) retention signal (His-Asp-Glu-Leu). Deletion of the KRE5 gene results in cells with aberant morphology and extremly compromised growth. KREI and KRE5 are useful as tools for the in vitro screening of antifugal agents which inhibit fungi pathogenic to plants and animals. The genes can be used to produce mutants for in vivo screening of antifungal agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Db
                                                                                                                                                                            The present invention relates to a method for determining the effect of a activity. The method comprises exposing an acceptor substrate for UGGT a labelled donor in the presence of the test sample and UGGT. The method is useful in a plucosyltransferase exsay and kinetics meathod is useful for determining UGGT activity. In particular, the method is useful in plucosyltransferase assay and kinetics measurement for determining UGGT activity. In particular, the method is determining UGGT activity, UGGT is a soluble enzyme of the endoplasmic reticulum which catalyses the addition of a glucose residue onto a paparagine-linked oligosaccharides, which are present on incorrectly folded glycoproteins. The present sequence was used in a sequence homology comparison with rat UGGT (see AAF60732 and AAB72436) which was used in the method of the present invention.

into peptide-containing targeting vectors for use in clinical positron mission terrors. Care in clinical positron mission terrors for the peptides with the peptide-containing thiol-containing peptides with comprises reacting a peptide comprising a free thiol group with a labeling reagent of formula: 18F (CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2-(CH2)m-CRIR2

This sequence represents an immunogenic peptide for a bi-specific antibody. The invention relates to a method of treating or identifying diseased tissues in a patient comprising administering a bi-specific antibody (or fragment) having at at least 1 arm (A) that specifically binds a targeted tissue and at least 1 arm (B) that specifically binds a targeted tissue and at least 1 arm (B) that specifically binds a targeted conjugate. The methods and bi-specific antibodies and fusion proteins are useful for pre-targeting methods of diagnosis and therapy. It is advantageous to raise bi-specific antibodies against a targetable conjugate that is capable of carrying at least 1 diagnostic or therapeutic agent. The characteristics of the chelator, metal chelate complex, therapeutic agent or diagnostic agent can be varied to accommodate differing applications without raising new bi-specific antibodies for each new application. The targetable conjugate is selected to elicit sufficient immune responses and also for rapid in vivo clearance when used within the bi-specific antibody targeting method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

```
The invention relates to isolated nucleic acid molecules and their encoded secreted proteins. The nucleic acids and proteins are used to prewnt, treat or annellocate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They mans, mice, are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoasays e.g. radioimmunoasays or enzyme linked immunosorbant assays (ELISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. corneal infection, and many other and sonders e.g. corneal infection, and many other disorders e.g. corneal infection, and many other disorders e.g. corneal infection, and many other disorders e.g. conneal infection, and many other disorders e.g. cuburn, to maintain organs before transplantation, for supporting call culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components. The present capacitic and other nutritional components. The present

The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to ercoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to production of other lead to the cell in the cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                       Nucleic acids encoding polypeptides with cytokine-like activities,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.

The antibodies can bind to human Tumour Growth Factor-beta (TGF-beta) II receptor, resulting in the inhibition of the signal transduction of human TGF-beta into cells. The antibodies can be used for the prevention and treatment of diseases associated with the production of TGF-beta, such as tissue fibrosis in the lung, liver, skin, kidney or other tissues, atherosclerosis, atopy, keloid and arthritis. The present sequence was

sequences of anti-adipocyte monotonal antibody heavy chain, light chain, and heavy chain complementarity determining regions (CDR) of the invention. The antibodies can be used in the treatment of obesity and obesity related diseases. The antibodies can be used to deliver drugs or pro-drugs directly to the far mass of an obese patient or the antibody can be used as a therapeutic itself. Antibodies binding specifically to adipocytes can be used to activate the immune system to destroy the cells by complement mediated lysis. The antibodies may be labeled with a chy complement mediated lysis. The antibodies may be labeled with a cused in methods of diagnosis in human subjects e.g. to determine the presence of adipocytes on the surface of an adipocyte to detect or determine the presence or level of adipocytes in a cell or tissue sample. The antibodies can be used as an alternative means of treatment for obese for different types of fat deposits can also be produced e.g. intra-abdominal fat associated with heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention
                        AAU02501-AAU02635, and AAU02641-AAU02748 represent the amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Drosophila; developmental biology; cell signalling; insecticide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Disclosure; SEQ ID NO 35820; 21pp. + Sequence Listing; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     QQ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      δλ
                                                               The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The carbon class are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. The polypetide and polynucleotide sequences have applications in capposable for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010 ABG30377 represent novel human and and activity of amino acid sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;
